

## Introduction of the resources for the CEMRACS' projects

Fabien Archambault

Aix-Marseille Université

- 1 Rheticus' configuration
- 2 Connection to the front-end
- 3 The Modules
- 4 OAR submission
  - Basics
  - Submission scripts
  - Resources
- 5 Visualisation
  - Asking for resources
  - Software and password
- 6 Tutorial, Libraries, softwares

## Global view of the hardware:

- One front-end computer (**login**);
- 96 fine nodes (**nodeXXX**, about 12 Tflops). For each nodes: 12 cores, Intel X5675 (Westmere), 24 GB of memory and InfiniBand QDR;
- 1 big memory node (**smp001**, about 600 Gflops) with 64 cores, Intel E7-8837, 1 TB of memory;
- 1 visualisation node (**visu**) with 12 cores, 64 GB of memory and 2 NVIDIA Quadro 5000 cards (2 GB of memory each);

## Global view of the hardware:

- One front-end computer (**login**);
- 96 fine nodes (**nodeXXX**, about 12 Tflops). For each nodes: 12 cores, Intel X5675 (Westmere), 24 GB of memory and InfiniBand QDR;
- 1 big memory node (**smf001**, about 600 Gflops) with 64 cores, Intel E7-8837, 1 TB of memory;
- 1 visualisation node (**visu**) with 12 cores, 64 GB of memory and 2 NVIDIA Quadro 5000 cards (2 GB of memory each);

For data storage, it is important to note that **no backup** is made! Usable disks are:

- NFS sharing (**/home**): disk for personal use (limited to **5 GB**);
- GPFS sharing (**/scratch**): fast disk for computation (about 8 GB/s for reading);
- CEMRACS sharing (**/softs/cemracs**): used to share data or libraries between projects for the CEMRACS' projects;
- Local nodes (**/tmp**): on fine nodes SSD disks are available (about 70 GB free). This folder is **purged** after each job.

The environment `modules` is used to define libraries and/or path to compilers. An example of available modules:

```
$ module avail

----- /softs/Modules -----
ATLAS/gcc/3.8.4                molekel/5.4.0
ATLAS/gcc46/3.8.4             mpich2/gcc/1.2.1
ATLAS/gcc47/3.8.4             mpich2/gcc/1.4.1
ATLAS/intel/3.8.4             mpich2/gcc46/1.4.1
ATLAS/smp/gcc47/3.8.4         mpich2/gcc47/1.4.1
ATLAS/smp/intel/3.8.4         mpich2/intel/1.4.1
[...]
```

For example, the compiler Intel 12.1 can be loaded with: `module load intel/12.1`.

The loaded modules are available with: `module list`.

To unload a module: `module unload intel/12.1`

The queue and job scheduler used is [OAR](#) for submitting jobs.

Basic commands are:

`oarsub -I`: interactive submission;

`oarsub -S ./mon_script.oar`: OAR script submission;

`oarstat`: show the submitted jobs (see also [Monika](#));

`oarsub -C JOB_ID`: to connect to compute nodes being used. The `JOB_ID` can be obtained with `oarstat`. On the master node, it is possible to connect to other nodes by achieving the command `oarsh name_node` where `name_node` can be obtained with: `cat $OAR_NODEFILE`;

`oardel JOB_ID`: delete the job. The `JOB_ID` can be obtained with `oarstat`.

OAR options to execute scripts are:

**#OAR -n name\_of\_job:** give a name to the job;

**#OAR -l resources:** specify asked resources. Example: to ask all CPUs on a node for 24 hours: `-l nodes=1,walltime=24:00:00`. To ask only one CPU: `-l core=1`;

**#OAR -O output:** specify the standard output. For example:  
`output.%jobid%.out`;

**#OAR -E error:** specify the error output. For example:  
`error.%jobid%.out`;

**More information:** consult the online [OAR 2.5.x](#) documentation.

**Important remark:** submission scripts need to be set as executables (`chmod +x ./mon_fichier.oar`).

To select the resources it is possible to use the option `-p resource`.

The properties for this option are:

**cluster**: fine nodes with fast interconnect and low latency (each nodes have 12 cores at 3.03 GHz);

**smp**: Symmetric MultiProcessing node (1 TB for 64 cores at 2.67 GHz);

**visu**: visualisation node (12 cores at 2.67GHz and 2 NVIDIA Quadro 5000 card).

From the front-end, to ask for a visualisation session:

```
[user@login ~]$ visu_sub.sh  
[ADMISSION RULE] Modify resource description with type  
constraints  
OAR_JOB_ID=559
```

Waiting job 559 to be running.

You can launch your VNC viewer on the address:

```
visu.ccamu.u-3mrs.fr:11  
Password: 28405608
```

Note: This password is only valid ONE time. If you want to generate another password for this session then type:

```
OAR_JOB_ID=559 oarsh visu vncpasswd -o -display visu:11
```

```
[user@login ~]$
```

To connect, you need a VNC client. We advise you to use [tigervnc](#) version 1.2 or higher.

From your local machine, start `tigervnc` and connect to the indicated address given at the submission and with the associated password.

It is possible to connect several people simultaneously on the same session (each connection need a different password). By default, `tigervnc` does not accept the sharing, it is important to tick the option *Shared (don't disconnect other viewers)*.

In the session, to start a 3D application for the shell terminal:

```
[user@login ~]$ vglrun /chemin/vers/mon/application
```

To ask for a new password (from the front-end):

```
OAR_JOB_ID=559 oarsh visu vncpasswd -o -display visu:11
```
