Automatic trace analysis with the Scalasca Trace Tools

Brian Wylie
Jülich Supercomputing Centre
Automatic trace analysis

- **Idea**
  - Automatic search for patterns of inefficient behaviour
  - Classification of behaviour & quantification of significance
  - Identification of delays as root causes of inefficiencies

- Guaranteed to cover the entire event trace
- Quicker than manual/visual trace analysis
- Parallel replay analysis exploits available memory & processors to deliver scalability
Scalasca Trace Tools: Objective

- Development of a **scalable trace-based** performance analysis toolset for the most popular parallel programming paradigms
  - Current focus: MPI, OpenMP, and POSIX threads

- Specifically targeting large-scale parallel applications
  - Such as those running on IBM Blue Gene or Cray systems with one million or more processes/threads

- Latest release:
  - Scalasca v2.5 coordinated with Score-P v5.0 (March 2019)
Scalasca Trace Tools features

- Open source, 3-clause BSD license
- Fairly portable
  - IBM Blue Gene, Cray XT/XE/XK/XC, SGI Altix, Fujitsu FX10/100 & K computer, Linux clusters (x86, Power, ARM), Intel Xeon Phi, ...
- Uses Score-P instrumenter & measurement libraries
  - Scalasca v2 core package focuses on trace-based analyses
  - Supports common data formats
    - Reads event traces in OTF2 format
    - Writes analysis reports in CUBE4 format
- Current limitations:
  - Unable to handle traces
    - With MPI thread level exceeding MPI_THREAD_FUNNELED
    - Containing CUDA or SHMEM events, or OpenMP nested parallelism
  - PAPI/rusage metrics for trace events are ignored
Scalasca workflow

- Measurement library
  - HWC
- Instr. target application
- Local event traces
- Parallel wait-state search
- Wait-state report
- Summary report
- Optimized measurement configuration

Scalasca trace analysis

- Which problem?
- Where in the program?
- Which process?

Score-P

- Instrumented executable
- Instrumenter compiler / linker
- Source modules

ANF WORKSHOP (OHP, FRANCE, 16-20 SEPT 2019)
Example: “Late Sender” wait state

- Waiting time caused by a blocking receive operation posted earlier than the corresponding send
- Applies to blocking as well as non-blocking communication
Example: Critical path

- Shows call paths and processes/threads that are responsible for the program’s wall-clock runtime
- Identifies good optimization candidates and parallelization bottlenecks
Example: Root-cause analysis

- Classifies wait states into direct and indirect (i.e., caused by other wait states)
- Identifies *delays* (excess computation/communication) as root causes of wait states
- Attributes wait states as *delay costs*
Case study: TeaLeaf
Case study: TeaLeaf

- HPC mini-app developed by the UK Mini-App Consortium
  - Solves the linear 2D heat conduction equation on a spatially decomposed regular grid using a 5 point stencil with implicit solvers
  - Part of the Mantevo 3.0 suite
  - Available on GitHub: http://uk-mac.github.io/TeaLeaf/

- Measurements of TeaLeaf reference v1.0 taken on Jureca cluster @ JSC
  - Using Intel 19.0.3 compilers, Intel MPI 2019.3, Score-P 5.0, and Scalasca 2.5
  - Run configuration
    - 8 MPI ranks with 12 OpenMP threads each
    - Distributed across 4 compute nodes (2 ranks per node)
    - Test problem “5”: 4000 × 4000 cells, CG solver

```bash
% cp -r /p/scratch/share/VI-HPS/examples/TeaLeaf . && cd TeaLeaf
% square scorep_tea_leaf_baseline_8x12_trace
INFO: Post-processing trace analysis report (scout.cubex)...
INFO: Displaying ./scorep_tea_leaf_baseline_8x12_trace/trace.cubex...
[GUI showing post-processed trace analysis report]
```
While MPI communication time and wait states are small (~0.6% of the total execution time)…
TeaLeaf Scalasca report analysis (II)

...they directly cause a significant amount of the OpenMP thread idleness
The “Wait at NxN” collective wait states are mostly caused by the first 2 OpenMP do loops of the solver (on ranks 5 & 1, resp.)...
...while the MPI point-to-point wait states are caused by the 3rd solver do loop (on rank 1) and two loops in the halo exchange.
TeaLeaf Scalasca report analysis (V)

Various OpenMP do loops (incl. the solver loops) also cause OpenMP thread idleness on other ranks via propagation.
The Critical Path also highlights the three solver loops...
TeaLeaf Scalasca report analysis (VII)

...with imbalance (time on critical path above average) mostly in the first two loops and MPI communication.
TeaLeaf Scalasca report analysis (VIII)

Computation time of 1st…
TeaLeaf Scalasca report analysis (IX)

...and 2nd do loop mostly balanced within each rank, but vary considerably across ranks...
TeaLeaf Scalasca report analysis (X)

...while the 3rd do loop also shows imbalance within each rank
TeaLeaf analysis summary

- The first two OpenMP do loops of the solver are well balanced within a rank, but are imbalanced across ranks
  ➞ Requires a global load balancing strategy
- The third OpenMP do loop, however, is imbalanced within ranks,
  - causing direct “Wait at OpenMP Barrier” wait states,
  - which cause indirect MPI point-to-point wait states,
  - which in turn cause OpenMP thread idleness
  ➞ Low-hanging fruit

- Adding a SCHEDULE(guided) clause reduced
  - the MPI point-to-point wait states by ~66%
  - the MPI collective wait states by ~50%
  - the OpenMP “Wait at Barrier” wait states by ~55%
  - the OpenMP thread idleness by ~11%
  ➞ Overall runtime (wall-clock) reduction by ~5%
Hands-on:
NPB-MZ-MPI / BT

trace tools scalasca
Performance analysis steps

- 0.0 Reference preparation for validation
- 1.0 Program instrumentation
  - 1.1 Summary measurement collection
  - 1.2 Summary analysis report examination
- 2.0 Summary experiment scoring
  - 2.1 Summary measurement collection with filtering
  - 2.2 Filtered summary analysis report examination
- 3.0 Event trace collection
  - 3.1 Event trace examination & analysis
Scalasca command – One command for (almost) everything

% scalasca
Scalasca 2.5
Toolset for scalable performance analysis of large-scale parallel applications
usage: scalasca [OPTION]... ACTION <argument>...
1. prepare application objects and executable for measurement:
   scalasca -instrument <compile-or-link-command> # skin (using scorep)
2. run application under control of measurement system:
   scalasca -analyze <application-launch-command> # scan
3. interactively explore measurement analysis report:
   scalasca -examine <experiment-archive|report>  # square

Options:
- c, --show-config           show configuration summary and exit
- h, --help                 show this help and exit
- n, --dry-run              show actions without taking them
   --quickref               show quick reference guide and exit
   --remap-specfile         show path to remapper specification file and exit
- v, --verbose             enable verbose commentary
- V, --version             show version information and exit

- The ‘scalasca -instrument’ command is deprecated and only provided for backwards compatibility with Scalasca 1.x., recommended: use Score-P instrumenter directly
Scalasca compatibility command: skin / scalasca -instrument

```bash
% skin
Scalasca 2.5: application instrumenter (using Score-P instrumenter)
   -comp={all|none|...}: routines to be instrumented by compiler [default: all]
      (... custom instrumentation specification depends on compiler)
   -pdt:  process source files with PDT/TAU instrumenter
   -pomp: process source files for POMP directives
   -user: enable EPIK user instrumentation API macros in source code
   -v:    enable verbose commentary when instrumenting
   --*:   options to pass to Score-P instrumenter
```

- **Scalasca application instrumenter**
  - Provides compatibility with Scalasca 1.x
  - **Deprecated! Use Score-P instrumenter directly.**
Scalasca convenience command: scan / scalasca -analyze

% scan
Scalasca 2.5: measurement collection & analysis nexus
usage: scan {options} [launchcmd [launchargs]] target [targetargs]
where {options} may include:
  -h  Help : show this brief usage message and exit.
  -v  Verbose : increase verbosity.
  -n  Preview : show command(s) to be launched but don't execute.
  -q  Quiescent : execution with neither summarization nor tracing.
  -s  Summary : enable runtime summarization. [Default]
  -t  Tracing : enable trace collection and analysis.
  -a  Analyze : skip measurement to (re-)analyze an existing trace.
  -e  exptdir : Experiment archive to generate and/or analyze.
               (overrides default experiment archive title)
  -f  filtfile : File specifying measurement filter.
  -l  lockfile : File that blocks start of measurement.
  -R  #runs : Specify the number of measurement runs per config.
  -M  cfgfile : Specify a config file for a multi-run measurement.

- Scalasca measurement collection & analysis nexus
Scalasca advanced command: scout - Scalasca automatic trace analyzer

```bash
% scout.hyb --help
SCOUT (Scalasca 2.5)
Copyright (c) 1998-2019 Forschungszentrum Juelich GmbH
Copyright (c) 2009-2014 German Research School for Simulation Sciences GmbH

Usage: <launchcmd> scout.hyb [OPTION]... <ANCHORFILE | EPIK DIRECTORY>
Options:
--statistics Enables instance tracking and statistics [default]
--no-statistics Disables instance tracking and statistics
--critical-path Enables critical-path analysis [default]
--no-critical-path Disables critical-path analysis
--rootcause Enables root-cause analysis [default]
--no-rootcause Disables root-cause analysis
--single-pass Single-pass forward analysis only
--time-correct Enables enhanced timestamp correction
--no-time-correct Disables enhanced timestamp correction [default]
--verbose, -v Increase verbosity
--help Display this information and exit
```

- Provided in serial (.ser), OpenMP (.omp), MPI (.mpi) and MPI+OpenMP (.hyb) variants
Scalasca advanced command: clc_synchronize

- Scalasca trace event timestamp consistency correction

```
Usage: <launchcmd> clc_synchronize.hyb <ANCHORFILE | EPIK_DIRECTORY>
```

- Provided in MPI (.mpi) and MPI+OpenMP (.hyb) variants
- Takes as input a trace experiment archive where the events may have timestamp inconsistencies
  - E.g., multi-node measurements on systems without adequately synchronized clocks on each compute node
- Generates a new experiment archive (always called ./clc_sync) containing a trace with event timestamp inconsistencies resolved
  - E.g., suitable for detailed examination with a time-line visualizer
Scalasca convenience command: square / scalasca -examine

% square
Scalasca 2.5: analysis report explorer
usage: square [OPTIONS] <experiment archive | cube file>
  -c <none | quick | full> : Level of sanity checks for newly created reports
  -F : Force remapping of already existing reports
  -f filtfile : Use specified filter file when doing scoring (-s)
  -s : Skip display and output textual score report
  -v : Enable verbose mode
  -n : Do not include idle thread metric
  -S <mean | merge> : Aggregation method for summarization results of
each configuration (default: merge)
  -T <mean | merge> : Aggregation method for trace analysis results of
each configuration (default: merge)
  -A : Post-process every step of a multi-run experiment

- Scalasca analysis report explorer (Cube)
Automatic measurement configuration

- scan configures Score-P measurement by automatically setting some environment variables and exporting them
  - E.g., experiment title, profiling/tracing mode, filter file, ...
  - Precedence order:
    - Command-line arguments
    - Environment variables already set
    - Automatically determined values
- Also, scan includes consistency checks and prevents corrupting existing experiment directories
- For tracing experiments, after trace collection completes then automatic parallel trace analysis is initiated
  - Uses identical launch configuration to that used for measurement (i.e., the same allocated compute resources)
Recap: Compiler and MPI modules, local installation

- Select appropriate compiler / MPI combination
  ```
  % module load Architecture/KNL  (JURECA booster only!)
  % module load Intel IntelMPI
  ```

- Copy tutorial sources to your scratch directory
  ```
  % jutil env activate -p cjzam11 -A jzam11 (any of your projects)
  % mkdir $SCRATCH/$USER
  % cd $SCRATCH/$USER
  % tar zxvf /p/scratch/share/VI-HPS/examples/NPB3.3-MZ-MPI.tar.gz
  % cd NPB3.3-MZ-MPI
  ```

- VI-HPS tools
  - CUBE release preview installed locally
  - Load environment modules, then load tool modules
    ```
    % module use /p/scratch/share/VI-HPS/JURECA/mf
    % module load Score-P Scalasca CubeGUI
    ```
BT-MZ summary measurement collection...

- Change to directory with the executable and edit the job script

```bash
% cd bin.scorep
% cp ../jobscript/jureca/scalasca2.sbatch .
% vim scalasca2.sbatch

# Score-P measurement configuration
export SCOREP_FILTERING_FILE=../config/scorep.filt
#export SCOREP_METRIC_PAPI=PAPI_TOT_INS,PAPI_TOT_CYC
#export SCOREP_TOTAL_MEMORY=250M

# Run the application using Scalasca nexus
#export SCAN_ANALYZE_OPTS="--time-correct"
NEXUS="scalasca -analyze -s"
$NEXUS srun $EXE

% sbatch scalasca2.sbatch
```

- Submit the job
BT-MZ summary measurement

Run the application using the Scalasca measurement collection & analysis nexus prefixed to launch command

- Creates experiment directory: scorep_bt-mz_C_8x6_sum
