

R et C++

Romain François

romain@r-enthusiasts.com
@romain_francois

Mise en route

Que font ces fonctions C++ ?
Chacune correspond à une fonction R de base

```
double f1(NumericVector x) {  
    int n = x.size();  
    double y = 0;  
    for(int i = 0; i < n; i++) {  
        y += x[i];  
    }  
    return y / n;  
}
```

```
NumericVector f2(NumericVector x) {  
    int n = x.size();  
    NumericVector out(n);  
    out[0] = x[0];  
    for(int i = 1; i < n; ++i) {  
        out[i] = out[i - 1] + x[i];  
    }  
    return out;  
}
```

Pourquoi C++ ?

Vectorisation

- La clé pour de bonnes performances en R est la vectorisation
- Vectorisation = Boucle écrite en C
- Vectorisation = Bon Vocabulaire
- ok d'écrire des boucles en C++

Probability you get a vaccination

```
vacc1a <- function(age, female, ily) {  
  p <- 0.25 + 0.3 * 1 / (1 - exp(0.04 * age)) +  
    0.1 * ily  
  p <- p * if (female) 1.25 else 0.75  
  p <- max(0, p)  
  p <- min(1, p)  
  p  
}
```

↓
Infected last year

```
# 🐱
```

```
vacc1a(40, TRUE, FALSE)
```

```
# 💔
```

```
vacc1a(c(20, 40),  
       c(TRUE, FALSE), c(FALSE, FALSE))
```

Vectorisation "barbare"

```
vacc1 <- function(age, female, ily) {  
  n <- length(age)  
  res <- numeric(n)  
  for( i in seq_len(n) ){  
    res[i] <- vacc1a( age[i], female[i], ily[i] )  
  }  
  res  
}  
  
vacc2 <- function( age, female, ily ){  
  mapply( vacc1a, age, female, ily )  
}
```

Ecrivez une version vectorisée de vacc1a

```
vacc1a <- function(age, female, ily) {  
  p <- 0.25 + 0.3 * 1 / (1 - exp(0.04 * age)) + 0.1 * ily  
  p <- p * if (female) 1.25 else 0.75  
  p <- max(0, p)  
  p <- min(1, p)  
  p  
}
```

```
vacc3 <- function(age, female, ily) {  
  p <- 0.25 + 0.3 * 1 / (1 - exp(0.04 * age)) +  
    0.1 * ily  
  p <- p * ifelse(female, 1.25, 0.75)  
  p <- pmax(0, p)  
  p <- pmin(1, p)  
  p  
}
```

version C++

```
// fonction non vectorisée

double vacc4a(double age, bool female, bool ily){
    double p = 0.25 + 0.3 * 1 / (1 - exp(0.04 * age)) + 0.1 * ily;
    p = p * (female ? 1.25 : 0.75) ;
    if( p < 0.0 ) p = 0.0 ;
    if( p > 1.0 ) p = 1.0 ;
    return p;
}

// [[Rcpp::export]]
NumericVector vacc4( NumericVector age, LogicalVector female, LogicalVector ily ){
    int n = age.size() ;
    NumericVector out(n) ;
    for( int i=0; i<n; i++){
        out[i] = vacc4a( age[i], female[i], ily[i] ) ;
    }
    return out;
}
```

Version R avec des astuces

```
vacc5 <- function(age, female, ily) {  
  p <- 0.25 + 0.3 * 1 / (1 - exp(0.04 * age)) + 0.1 * ily  
  p <- p * (0.5 * female + 0.75)  
  p[p < 0] <- 0  
  p[p > 1] <- 1  
  p  
}
```

version C++ bonus (avec mapply)

```
// fonction non vectorisée
double vacc4a(double age, bool female, bool ily){
    double p = 0.25 + 0.3 * 1 / (1 - exp(0.04 * age)) + 0.1 * ily;
    p = p * (female ? 1.25 : 0.75) ;
    if( p < 0.0 ) p = 0.0 ;
    if( p > 1.0 ) p = 1.0 ;
    return p;
}

// [[Rcpp::export]]
NumericVector vacc6( NumericVector age, LogicalVector female, LogicalVector ily ){
    return mapply( age, female, ily, vacc4a ) ;
}
```

```

bench_all <- function(n){
  age <- rnorm( n, mean = 35, sd = 5)
  ily <- sample( c(T,F), n, replace = TRUE )
  female <- sample( c(T,F), n, replace = TRUE )

  microbenchmark(
    barbare      = vacc1(age, female, ily),
    mapply       = vacc2(age, female, ily),
    vectorised   = vacc3(age, female, ily),
    astuce       = vacc5(age, female, ily),
    cpp          = vacc4(age, female, ily),
    cpp_mapply  = vacc6(age, female, ily)
  )
}

```

> bench_all(1e4)

```

Problèmes difficiles avec R

- Pas possible de vectoriser parce que l'itération dépend des résultats précédents
- Appels récursifs ou nombreux à des fonctions
- Structures de données avancées

Pourquoi C++

- Moderne, haute performances
- Contrôle précis de l'allocation mémoire
- Bonnes libraries standard (stl, boost, ...)
- Plus facile que le C ou le Fortran
- Pas trop compliqué à apprendre

Pourquoi pas C++

- Apprendre un autre langage
- Temps de développement plus long
- Finalement, c'est peut être plus simple d'augmenter son vocabulR

**Ce que Rcpp fait
pour vous**

```
library(Rcpp)
cppFunction('int one() {
  return 1;
}', verbose = TRUE)
one()
```

Fichier .cpp généré

```
#include <Rcpp.h>
using namespace Rcpp;

// [[Rcpp::export]]
int one() {
    return 1;
}
```

Code généré d'interfaçage avec R:

```
#include <Rcpp.h>

// one
int one();
RcppExport SEXP sourceCpp_51404_one() {
BEGIN_RCPP
    Rcpp::RObject __result;
    Rcpp::RNGScope __rngScope;
    __result = Rcpp::wrap(one());
    return __result;
END_RCPP
}
```

Compilation

```
/Library/Frameworks/R.framework/Resources/bin/R CMD SHLIB -o  
'sourceCpp_567.so' 'one.cpp'  
clang++ -I/Library/Frameworks/R.framework/Resources/include -  
DNDEBUG -I/usr/local/include -I/usr/local/include/freetype2 -  
I/opt/X11/include -I"/Library/Frameworks/R.framework/  
Versions/3.2/Resources/library/Rcpp/include" -I"/private/tmp"  
-fPIC -O3 -c one.cpp -o one.o  
clang++ -dynamiclib -Wl,-headerpad_max_install_names -  
undefined dynamic_lookup -single_module -multiply_defined  
suppress -L/Library/Frameworks/R.framework/Resources/lib -L/  
usr/local/lib -o sourceCpp_567.so one.o -F/Library/Frameworks/  
R.framework/.. -framework R -Wl,-framework -Wl,CoreFoundation
```

Chargement de la DLL

```
` .sourceCpp_51404_DLLInfo` <-
dyn.load('/var/folders/2p/
w41bln195jv507lc9mffd0fr0000gn/T//_
RtmpA49Ij/sourcecpp_111a33418ed6/
sourceCpp_567.so')
```

Création de la fonction R:

```
one <-
Rcpp:::sourceCppFunction(function() {},  
FALSE, `.`.sourceCpp_51404_DLLInfo`,  
'sourceCpp_51404_one')
rm(`.`.sourceCpp_51404_DLLInfo`)
```

Comment en bénéficier:

- `install.packages("Rcpp")`
 - Sur windows, installer Rtools
 - Sur OSX, installer Xcode et les outils
- Gérez votre PATH, ou utilisez RStudio

Fonctions

c++

Environnement de base

- Les fonctions C++ vivent dans un fichier .cpp
- On les "source" avec sourceCpp
- Rcp s'occupe du reste

```
#include <Rcpp.h>
using namespace Rcpp ;

// [[Rcpp::export]]
int one(){
  return 1 ;
}
```

}

Vrai code

```
> sourceCpp( "one.cpp" )
> one()
[1] 1
```

Ecrire une fonction two() qui retourne 2

Défi 1 : Pas de copier/coller

Défi 2 : De mémoire

Types de base

R	Vector	Scalar
character	CharacterVector	String
double	NumericVector	double
integer	IntegerVector	int
logical	LogicalVector	bool

Scalaires en entrée et en sortie

```
#include <Rcpp.h>
using namespace Rcpp ;

// [[Rcpp::export]]
double add( double x, double y){
  return x + y ;
}
```

Exercice

- Ecrire une fonction norme: $f(x,y) = \sqrt{x^2 + y^2}$
- En utilisant `pow(,2.0)` and `pow(, 0.5)`
- Avec `sqrt` et une fonction `square`

```
#include <Rcpp.h>
using namespace Rcpp;

// [[Rcpp::export]]
double norm1( double x, double y){
    return pow( pow(x,2) + pow(y,2), 0.5 ) ;
}

}
```

```
#include <Rcpp.h>
using namespace Rcpp;

inline double square( double x){
    return x*x ;
}

// [[Rcpp::export]]
double norm2( double x, double y){
    return sqrt( square(x) + square(y) ) ;
}
```

Vecteurs en entrée
Scalaires en sortie

```
sumR <- function( x ){
  res = 0
  for( i in seq_along( x ) ){
    res = res + x[i]
  }
  res
}
```

```
#include <Rcpp.h>
using namespace Rcpp;

// [[Rcpp::export]]
double sumCpp( NumericVector x){
    double res = 0.0;
    int n = x.size();
    for( int i=0; i<n; i++){
        res += x[i] ;
    }
    return res ;
}
```

En C++ les vecteurs
commencent à 0

**En C++ les
vecteurs
commencent
à 0**

En C++ les
vecteurs
commencent
à 0

Exercice

Ecrire une fonction weighted_mean

Comparez la avec la version base weighted.mean et à cette version inefficace :

```
weighted_mean <- function(x, w) {  
  total <- 0  
  total_w <- 0  
  for (i in seq_along(x)) {  
    total <- total + x[i] * w[i]  
    total_w <- total_w + w[i]  
  }  
  total / total_w  
}
```

```
#include <Rcpp.h>
using namespace Rcpp ;

// [[Rcpp::export]]
double weighted_mean_cpp( NumericVector x, NumericVector w){
  int n = x.size() ;
  double total = 0.0 ;
  double total_w = 0.0 ;
  for( int i=0; i<n; i++){
    total += x[i] * w[i] ;
    total_w += w[i] ;
  }
  return total / total_w ;
}
```

RcppParallel

(tbb)

Appeler une fonction simple en parallèle

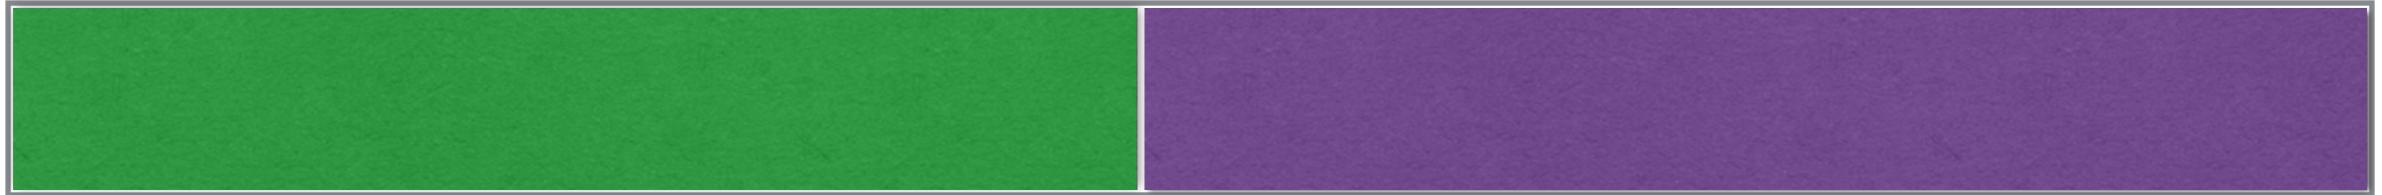

```
x <- rnorm(1e6 )  
y <- sqrt(x)
```

Version séquentielle avec Rcpp

```
#include <Rcpp.h>
using namespace Rcpp ;

// [[Rcpp::export]]
NumericVector cpp_sqrt( NumericVector x ){
    int n = x.size();
    NumericVector y = no_init(n) ;
    for( int i=0; i<n; i++){
        y[i] = sqrt(x[i]) ;
    }
    return y ;
}
```

x

sqrt

sqrt

y

```
#include <Rcpp.h>
#include <RcppParallel.h>
using namespace Rcpp ;
using namespace RcppParallel ;

// [[Rcpp::depends(RcppParallel)]]
struct SquareRoot : public Worker {
public:
    SquareRoot( const NumericVector& x_, NumericVector& y_ ) : x(x_), y(y_){}
    void operator()( std::size_t begin, std::size_t end ){
        for( std::size_t i=begin; i<end; i++){
            y[i] = sqrt( x[i] ) ;
        }
    }
private:
    const NumericVector& x ;
    NumericVector& y ;
};

// [[Rcpp::export]]
NumericVector cpp_sqrt_parallel_1( NumericVector x ){
    int n = x.size();
    NumericVector y = no_init(n) ;
    SquareRoot obj( x, y ) ;
    parallelFor( 0, n, obj ) ;
    return y ;
}
```

```
> x <- runif( 1e6 )
> microbenchmark( R = sqrt(x), serial = cpp_sqrt(x), parallel = cpp_sqrt_parallel_1(x) )
Unit: milliseconds
    expr      min       lq     mean   median      uq     max neval
      R 5.097073 7.023715 7.271958 7.140185 7.433031 10.053800    100
  serial 4.228400 6.961709 9.325789 7.134970 7.303951 225.694180    100
